

- Encapsulation - Bundling data (attributes) and the methods that operate on that within a single unit, called class
- Inheritance - Subclass inherits properties and behaviours

→ 200 - OK

201 - Created

204 - No content

400 - Bad Request

401 - Unauthorised

403 - Forbidden

404 - Not found

500 - Internal server error

→ Scheduling algorithms -

• FCFS

SJF

Round Robin

Priority scheduling

Multilevel Queue

→ SQL:

Indexing - Special lookup tables

Transaction - Sequence of DB operations that are performed as a single logical unit of work.

↳ Atomicity - All success or all fail

Consistency - One valid state to another

Isolation -

Durability

Primary key - uniquely identify each row in that table

Foreign key - Establish link to the primary key in another table

Normalization - organize data to reduce redundancy and improve data integrity

↳ 1NF - Atomic values and each entry is of same data type

2NF - 1NF; non-key attributes are fully functionally dependant on primary key

3NF - 2NF, all

others BCNF, 4NF & 5NF

Please do not throw sausage pizza away

URBAN
EDGE

→ Deadlock - Mutuallex, Hold & wait, No preemption, circular wait

→ ~~Scheduling algo~~ ~~FIFO~~ → Access modifiers - Private Protected
Default Public

→ OSI model - Physical, Data link, Network, Transport, Session,
Presentation, Application

→ EC2 - VM

ECS/EKS - Docker pushing

S3 - Object storage

RDS - DB services

IAM - Access management

VPC - Virtual private network

→ HTTP methods - GET, POST, PUT, DELETE PATCH
